Lecture - Introduction to Penetration Testing

09:00 22/01/24 Tobi Fajana

Weekly Teaching Materials

- 1 hour lecture
- 2 hour practical
- Instructional video (Guide for Labs)
- · Compulsory Moodle quiz

Assessments

- Practical Exam, 2 hours (50%, 20/03/2024)
 - 2 Devices to exploit
 - 5 Vulnerabilities expected, give the name, software, risk rating, a brief description, and corrective actions for each exploit
- Muliple Choice Exam, 1 hour (50%, May/June)

CIA

- The three main properties which are protected by cyber security
- Confidentiality Protecting information from being disclosed to unintended parties
- Integrity Protecting information from being modified, intentionally or otherwise
- Availability Ensuring the information is available to access when it is needed

Penetration Testing

- Black Box No information about the target
- Grey Box Some information about the target, but not all
- White Box All information given, including source code, etc
- Timeframe There is usually a fixed timeframe for the test
- Penetration Testing is similar to vulnerability assessment, but actual exploits the vulnerabilities

Port Scanning

- Scan every port on a server to check which ports are open
- Attempt to ping the server on each port
- If a response is given from a port, it must be open

Lecture - Information Gathering

09:00 29/01/24 Tobi Fajana

Active Information Gathering

- Directly interacting with the target
- You typically gather more information actively, but you are much more likely to get caught
- · Active methods include
 - Probing the Network (Port scanning, service version enumeration)
 - Social Engineering (Password gathering with phishing)
 - Directory and Share scanning

Passive Information Gathering

- · Avoid direct interaction as much as possible
- Much less likely to be caught, but less information is gathered
- · Passive methods include
 - Using a Search Engine
 - Physical Observation (Looking over shoulder when typing a password)
 - DNS enumeration (Whois lookup, IP address lookup, shodan, etc)
 - OSINT Framework (Open Source Intellegence Network Google Dorking, shodan, social media analysis)
 - GeoLocating people based upon images on social media
 - Searching on pastebin and other similar websites for the target
 - Looking on websites such as haveibeenpwnd.com to check if passwords for the target have been leaked
